

Volume 31, Issue 1**Research Announcement****Co2 emissions, energy imports, economic growth in pakistan: causality analysis**

Muhammad Anees

COMSATS Institute of Information Technology

Abstract

Following the most followed time series econometric methodology of ARDL and Granger causality, this paper will explore the relationships among the important energy market variables for Pakistan being a major importer of oil and energy products. It is expected that controlling for imports of oil and energy products, substituting furnace oil dependent energy production by hydal power houses, Pakistan can significantly contribute towards reduction of emission of CO₂ to achieve global targets.
