Research Announcement

The minimal dominant set is a non-empty core-extension

László Á. Kóczy Catholic University Leuven

Abstract

A set of outcomes for a TU-game in characteristic function form is dominant if it is, with respect to an outsiderindependent dominance relation, accessible (or admissible) and closed. This outsider-independent dominance relation is restrictive in the sense that a deviating coalition cannot determine the payoffs of those coalitions that are not involved in the deviation. The minimal (for inclusion) dominant set is non-empty and for a game with a non-empty coalition structure core, the minimal dominant set returns this core.
