7th INFER Annual Conference 2005 Regional Economics: New challenges for theory, empirics and policy October 7 - 9, 2005, London, United Kingdom As counterpart of globalisation and economic integration the local and regional basis of economic activities has gained increasing attention of economic researchers and policy makers. Clusters, local networks, knowledge spillovers, institutional settings, endowment with immobile factors, market access and other regional factors are seen as main determinants of the competitiveness in the process of regional growth and convergence. Economic research dealing with processes on a regional level can help to understand these developments and provide policy makers with relevant insights. The 7th Annual Conference of the International Network for Economic Research aims at providing a platform to discuss current theoretical and empirical research projects. Further information on paper submission, participation, keynote speakers etc. are available at [www.infer-research.net](http://www.infer-research.net)
